

Sticky Box :

Sticky Box

The self-absorbing box is made of special glue solidified on the bottom of the plastic box. The glue has the characteristics of moisture resistance, ozone resistance, radiation resistance and high temperature resistance, and the use temperature is -60°C to 200°C. (: Within the scope, the nature of the glue does not change. After the glue is cured, the surface has self-adhesiveness, and the optical lens, crystal or semiconductor components can be firmly fixed in the box by using self-adhesiveness, even if the box is tilted, shaken or inverted, the components It can still be fixed in place without moving. If you want to take out the component from the box, you can easily clamp it with tin. According to the shape of the component and the surface roughness, you can choose the appropriate glue viscosity, divided into ultra - low Viscosity (XL), low viscosity (L), medium viscosity (M) and high viscosity (H) are available.

The outer box of the self-adhesive box can be selected in different colors according to needs, including transparent (T), black (B), conductive black (CB) and transparent anti-static (CT) .
